

Coding Marathon Problem Statement 2

Create a class Invoice with the following attribute

- **invoiceNumber** which could be alphanumeric.
- **invoiceType** which could be either E_BILL, PAPER_SLIP or SMS_GENERATED.
- **invoiceItems** which indicates the count of items (sold/purchased) on the invoice.

Create a class Bill with the following attributes

- **billAmount** which could be float.
- **billTaxAmount** which could be float and must be less than the billAmount (as billAmount includes tax).
- **billAssociatedInvoice** that stores a reference of an Invoice instance to indicate the details of invoice attached to the bill

Create a functionalities.cpp file for the following

- A function to find and return the ***invoiceNumber*** of the Bill instance with the highest ***billAmount*** from a data container of Bill instances.
- A function to find and return the ***billAmount*** for an Invoice instance whose ***invoiceNumber*** is provided as an argument from a data container of Bill instances.
- A function to find and return the ***billAssociatedInvoice*** instances in a container for all Bill instances stored in a data container whose billAmount is over a threshold passed as an argument as well.
 - Hint: Loop over Bill instances to find instances whose ***billAmount*** is over the threshold provided as parameter
- A function that prints the ***invoiceNumber*** of the Bill object with maximum & minimum ***billAmount***

Demonstrate all functionalities by creating a Main.cpp file
